

There are many opportunities to interact with the super-interface of the plugin. First, try to adjust the position of the modules columns. The width of the columns on the right will automatically follow the width of the hierarchy window if you change it during operation.

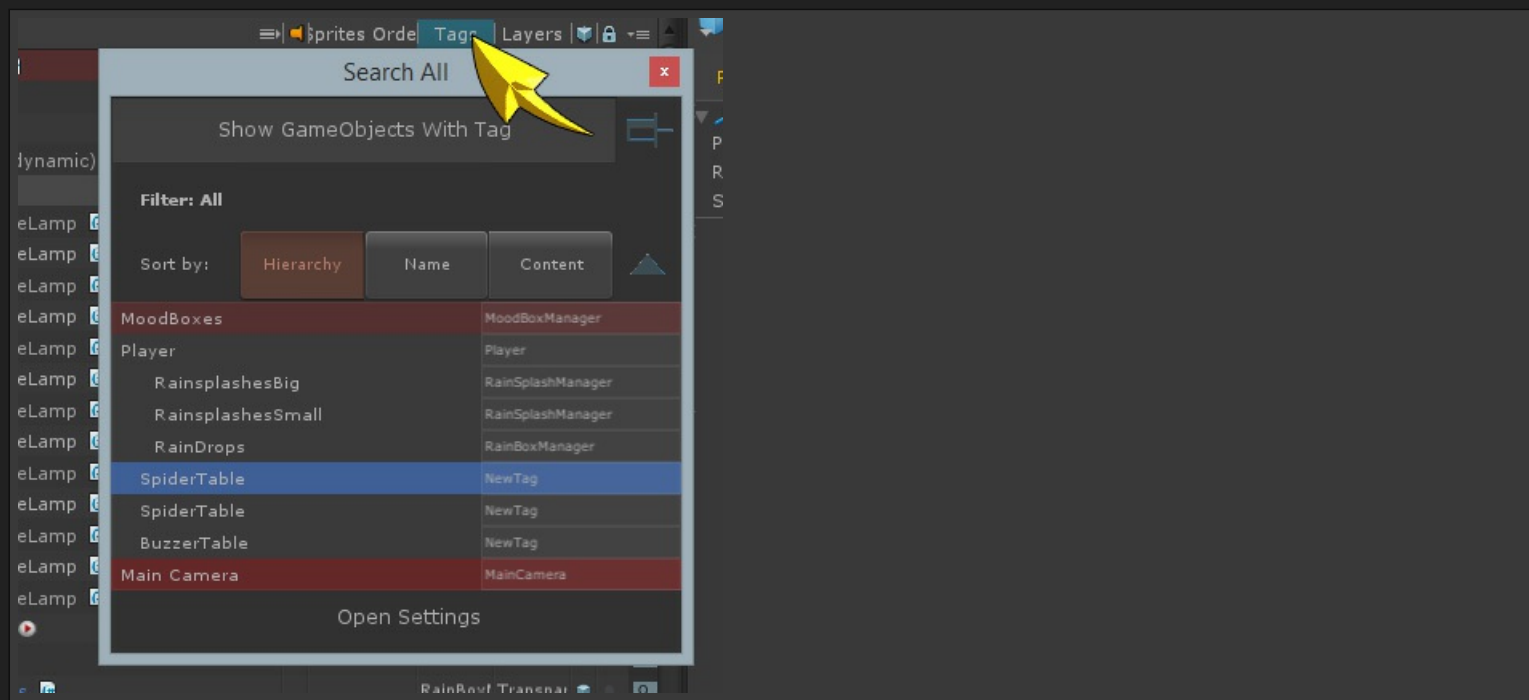

- To change the overall width of the entire right side, click and drag the leftmost three-stripe icon indicated by the first-to-the-left top arrow, which is the general settings button.
- To change the order of sprites, click and drag the module name to the place where the second-to-the-left top arrow points.
- To change the width of the column, click and drag the partition between the names of the modules to the place where the third-to-the-left top arrow points.
- To call the menu, left-click on the name of any module.

Hide This Category	Hide the current module
Modules	Hide / Show modules (see 'Right Panel')
Default	Show modules by default
Show All	Show all modules
Hide All	Hide all modules
Auto-Hide If Width < 350	Automatically hide all modules if the width of the window is less than 350. The minimum width can be changed in settings
Bind Header To The Top	Link the line with the headings to the zero position. If the option is disabled, the line with the headers remains fixed at the top of the window
Open Settings	Open settings in the inspector

- The elements of the plug-in are accompanied with pop-up hints so that if the action of some element is unclear, you can hover the mouse over it and wait for the tip.
- To call the search by parameters, right-click on the module name.

The window will display all objects to which any parameters of the current module are assigned (see 'Other Tips' for more details)
